Radiometer

850700 **\$5.49 per each**

Radiometer

WL1734

Show the effect of differential absorption of radiation and expansion of residual gas. A rotating shaft inside the 99% evacuated glass globe has four attached vanes. Each vane has a black face and a white face. Illuminate the bulb with an ordinary incandescent light. Watch the vanes spin as the black sides absorb more heat than the white ones, and thus expand the neighboring gas at a greater rate. The sphere is approximately 7.6cm in dia. Overall height with glass base: 12cm.

Gooseneck Eyewash Adapter
WLS33816-05

Eye Wash Fountain Fixture. Dependable, effective eye wash fountain is easily installed on existing faucets without additional plumbing. The diverter, which replaces the existing aerator on a faucet, is designed so that the pull of a button directs two streams of water upward into both eyes simultaneously. It closes automatically when the faucet is turned off or the button is pushed. The unit is in two pieces, so the eyewash sits behind the spout, out of the way of everyday use but in position for an emergency. Removable fountain tips and aerator make cleaning simple. Chrome-plated brass unit has male/female threaded universal adapters for installation to outside or inside threaded faucet tips of varying dimensions. Tip covers protect against foreign objects and slide off with the first thrust of water. Meets ANSI Z358 Standard.

850910 **\$228.48 per each****Ear Model - Giant Three-Part Ear
WL95026**

Five time life-size, three-part, nonbreakable polymer reproduction depicts that human organ of hearing and balance for a functional equilibrium demonstration. The surrounding temporal bone of the skull has been sagittally sectioned along the entire length of the auditory canal and Eustachian tube. This simplifies tracing the path of soundwaves entering the ear and makes it quite evident how pressure is equalized on both sides of the eardrum. The overlying petrous portion of the temporal bone has also been cut away exposing the entire middle ear chamber and the labyrinth. Two of the middle ear ossicles, the malleus (hammer) and incus (anvil), and the attached see-through tympanic membrane lift out for hands-on study. Also detachable is the entire labyrinth unit consisting of the cochlea, vestibule, semicircular canals, auditory nerve and the third ossicle, and the stapes (stirrup). Two of the three semicircular canals are made of transparent plastic tubing filled with colored fluid representing the endolymph. A visible air bubble in each will shift position when tilted, demonstrating the function of the canals in maintaining equilibrium. A spiral cutaway of the cochlea shows its three canals in contrasting colors to enhance teaching the concept of pitch. Includes 36 hand-numbered features identified in the accompanying key. 16" x 11" x 7".

Sensory regions highlighted include the separate reception and interpretive centers of the visual, acoustic, touch, taste and olfactory senses, plus sensory centers of the somatosensory cortex receptive to more than 20 specific body regions. Among the motor centers presented are 19 body regions controlled by the motor cortex, the premotor area and the motor speech area of Broca.
